

User Manual

Data Management Portal -- guide to every module

Generated on: 23/07/2026

Audience: database administrators and data teams

1. What the portal is

The Data Management Portal brings together the records a data team usually scatters across spreadsheets: registered databases, who has access to what, structural changes, backup, restore tests, dictionary, integrations and scheduled routines.

It does not connect to the managed databases nor run anything on them -- it is a record of what the team agreed and of what happened.

The screen

The sidebar lists the modules and, at the bottom, the user panel with photo, name and shortcuts to change password and sign out. At the top sit the module icon and title, search, light/dark theme, language and the profile shortcut.

2. Databases: the central registry

The Databases module is the heart of the setup: each database is registered once -- with hostname, engine, environment, IPv4 and IPv6 addresses and ports -- and reused across the other modules, instead of retyping server and name every time.

Field	What to record
Banco	Database name.
Hostname	Server where the database runs (hostname only).
Motor	MySQL, PostgreSQL, SQL Server, Oracle...
Ambiente	Production, Staging, Development, Test.
IPv4 address / Port	IPv4 address and its port.
IPv6 address / Port	IPv6 address and its port.

A database is unique by hostname + name: the same server can host several databases, but not two with the same name. When you pick a database in Access, Backup, Restore, Dictionary or Jobs, the server fills in automatically.

3. How the lists work

Every module behaves the same: search, filters, column choice, bulk-delete selection and export (CSV, PDF or e-mail). Clicking Add or a row opens the record window in the centre of the screen.

List fields -- type, environment, criticality, status -- come from the Cadastro module; database fields come from the Databases module.

4. The modules

Access

Inventory of who has access to what -- the module most asked for in audits.

Field	What to record
Conta	Authentication type (SQL Login, Windows Login, AD Group).
Account nature	User or Service -- e.g. APP_BUSCA_CADASTRO is Service.
Banco	Picked from the Databases registry; fills the server.
Server	Hostname, filled by the chosen database.
Access level	Permissions granted.
Justification	Why the access exists.

Changes

Record of what changed in the structures.

Field	What to record
Affected databases	Multiple selection of registered databases.
Objects	Affected objects, with the type of each.
Script and rollback	What was run and how to undo it.

Filling in the rollback at the time of the change is what makes the record useful at three in the morning.

Backup and Restore

Backup policy per database and restore tests, each with its own Add button.

Field	What to record
Banco	Picked from the registry.
Policy	Type, window, retention and destination.
Restore	Tests performed, with time and outcome.

A backup without a restore test is an assumption.

Jobs

Scheduled routines: loads, purges, reindexing.

Field	What to record
Command / Step	Steps: name and what it runs.
Banco	Picked from the registry; fills the server.
Schedules	Execution windows (start and end).
Status	Active or Disabled.

Dictionary and Integrations

Business meaning of the columns and flows between systems.

Field	What to record
Dictionary	Database, table, column and what it means.
Integrations	Source, target, window and owner.

Cadastro

The lists that feed the selection fields, in cards per module.

Field	What to record
Add / Rename	The option starts appearing in the matching form.

5. Administration

Each account has a role (leitura, escrita, admin, master) and a list of allowed modules. When editing a user, the Photo field lets you change or remove that person photo.

Disabling an account is better than deleting it: history and trail stay intact, and the person can no longer sign in.

6. Documentation

The Documentation module delivers three PDFs, in Portuguese and English: this manual, the API manual and the diagram with the internal database dictionary. They are generated from the code, so they follow the changes of the tool.
