Data Management Portal -- guide to every module

Generated on: 04/08/2026

Audience: database administrators and data teams

1. What the portal is

Brings together a data team records: registered databases, access, changes, backup, restore, dictionary, integrations and jobs. It does not connect to the managed databases -- it is a record of what the team agreed and of what happened.

2. Databases and the modules

Each database is registered once in the Databases module (hostname, engine, environment, IPv4/IPv6) and reused in Access, Backup, Restore, Dictionary and Jobs, which select it instead of retyping. Access distinguishes user and service accounts; Changes flags several affected databases; the Dictionary accepts CSV import.

The Changes module, besides the record, generates an Audit report in PDF for a period (scope, summary by status and the list of changes with approver and outcome), with download and e-mail delivery -- the same format as the Certification, for auditing.

3. Users and permissions

Each account has a role (leitura, escrita, admin, master) and a list of allowed modules. The record stores photo, network login, department and position. The screen allows bulk-importing accounts via CSV, which enter with the Leitura role and no modules (flagged as "no access" until an admin grants it).

4. Access Certification

Under Administration, the module cross-checks the REAL permissions of a database against what is registered in Access -- the basis of a periodic certification for external audit. The portal does not connect to the database: the extraction is an external step, under the DBA credentials.

Step	What to do
1	Choose the database and period. Engine buttons (SQL Server, MySQL, PostgreSQL) show the ready extraction query; a button downloads the CSV template.
2	Run the query on the database (under your credentials) and export the result to CSV. The CSV carries the database column.
3	Upload the CSV; the portal cross-checks against Access and flags the exceptions.
4	Generate the PDF report, download or e-mail it, and save to history.

The cross-check flags three situations: undocumented access (in the database, not registered -- high risk), stale records (in the portal, absent in the database) and compliance. The history sits on the side, with each cycle summary and buttons to download or e-mail the report at any time.

An administrator registers certifications, but only master can delete them from history -- preserves the trail, like Audit. The portal stores only the summary (counters and exceptions), never the raw permissions CSV.

5. Documentation

The Documentation module delivers three PDFs in Portuguese and English: this manual, the API manual and the diagram with the internal database dictionary. They are generated from the code, so they follow the changes of the tool.
