

User Manual

Data Management Portal -- guide to every module

Generated on: 28/07/2026

Audience: database administrators and data teams

1. What the portal is

The Data Management Portal brings together the records a data team usually scatters across spreadsheets: registered databases, access, changes, backup, restore tests, dictionary, integrations and scheduled routines.

It does not connect to the managed databases nor run anything on them -- it is a record of what the team agreed and of what happened.

2. Databases: the central registry

Each database is registered once -- hostname, engine, environment, IPv4 and IPv6 addresses and ports -- and reused across the other modules. When you pick a database in Access, Backup, Restore, Dictionary or Jobs, the server fills in automatically. A database is unique by hostname + name.

3. How the lists work

Every module behaves the same: search, filters, column choice, bulk-delete selection and export (CSV, PDF or e-mail). Clicking Add or a row opens the record window in the centre of the screen.

List fields come from the Cadastro module; database fields come from the Databases module. The Dictionary accepts CSV import, with a template to download.

4. The modules

Access

Inventory of who has access to what.

Field	What to record
Conta	Authentication type (SQL Login, etc.).
Account nature	User or Service.
Banco	Picked from the registry; fills the server.
Access level	Permissions granted.

Changes

Record of what changed in the structures.

Field	What to record
Affected databases	Multiple selection of databases.
Script and rollback	What was run and how to undo it.

Backup, Restore and Jobs

Backup policy, restore tests and scheduled routines -- all pick the database from the registry.

Field	What to record
Banco	From the Databases registry.
Schedules	Execution windows (Jobs).

Dictionary and Integrations

Meaning of the columns and flows between systems.

Field	What to record
Dictionary	Database, table, column and meaning. CSV-importable.
Integrations	Source, target, window and owner.

5. Users and permissions

Each account has a role (leitura, escrita, admin, master) and a list of allowed modules: the role says what the person can do, the list says where. The user record also stores photo, network login, department and position.

The Users screen allows bulk-importing accounts via CSV (Import button, with a template to download). Each row becomes a user with the Leitura role and no modules -- that is, no access to anything until an administrator grants it. The password is left blank: the portal generates a temporary one with a mandatory change and, if SMTP is configured, sends the credentials. Whoever enters with no module is flagged as "no access" in the list.

The Roles screen lists all users with their role and allowed artifacts, and has a search that filters both by user and by allowed artifact.

Disabling an account is better than deleting it: history and trail stay intact, and the person can no longer sign in.

6. Documentation

The Documentation module delivers three PDFs, in Portuguese and English: this manual, the API manual and the diagram with the internal database dictionary. They are generated from the code, so they follow the changes of the tool.
